Whilst we had planned to conduct a panel analysis in our PAP, after receiving the 5% sample of the data, we discovered that this would not be possible because our selected variables either only appeared in one year (H1 and H4) or had insufficient observations to allow us to run our planned analyses after implementing our exclusion criteria (H2 and H3). Therefore, we opted instead to conduct a cross-sectional analysis with the one year in which all our variables appeared. While it may have been possible to run the analyses for H2 and H3 with the remaining 95% of the sample included, we opted to also conduct a cross-sectional analysis to answer H2 and H3 to make results comparable to results from H1 and H4. All other data treatments and exclusion/inclusion criteria are followed as in the PAP. We also include all code necessary to conduct our PAP analysis, which are commented out in our do-file.
