We truly enjoyed working on the project and greatly appreciated the continuous support and clear communication from the coordinators throughout the process. Being in the no-data group made it challenging to anticipate the availability and coverage of key data variables, which required us to make several assumptions during the planning stage. While our original research question would have ideally called for a causal analysis, the data constraints led us to adopt a correlation-based design instead. However, even the correlation-based design would have been implemented differently if we had been a data group rather than a no-data group. Overall, it was a rewarding and thought-provoking experience.
